VIDEO NOTES

TECHNICAL:

PATCH TESTS

Warning: A skin test must be performed 24 hours prior to first Adhesive or Bond application, as some people may develop an allergic reaction either initially or after continuous use. No warranty, expressed or implied, is made to any user. Instructions for safe use must, without exception, be followed:

Patch Test

1. All applications must be done in a highly-ventilated area. For details, see warning.
2. Cleanse a small area inside of the forearm with a mild shampoo, rinse off. Let dry completely.
3. Apply a small amount of selected Adhesive directly to skin and cover with 3M Transpore Tape (code G390). Allow time to dry before coming in contact with clothing. Leave unwashed for 24 hours.
4. After 24 hours, make a visual inspection of the area to be certain that no redness, irritation, burning, itching, swelling, or other abnormal reactions have occurred in or around the skin test area. Discontinue use of that Adhesive if a negative reaction occurs, and proceed to skin test another Adhesive until you find one that is compatible.
5. Adhesive should not be used when the scalp or adjacent area shows evidence of any redness, abrasion, disease, or abnormal condition.
6. If the client insists on an Adhesive application without first giving an Adhesive skin test, please have the client sign a release form of "no responsibility" before proceeding.
7. If any irritation or abnormal reaction is found after continued use of any Adhesive, it is recommended that you discontinue use of that particular Adhesive until further skin tests are completed
